# Handle Always in the middle when Dimension Variable = True

**Technical Note 2006.3.001**

July 2006

To Calculate the Handle Height PrefCAD always has worked in the next way:

- If DimensionVariable = False:
  - The handle height is assigned by VBA or
  - The handle height is set by constructive link by the AlturaManeta volatile option or
  - If the handle height has not been set by any code (VBA or script) is calculated in the middle
- If DimensionVariable = True:
  - The user sets the handle height in the properties dialog.

In 2006.3 version, a new possibility has been added. When Dimension Variable = True, the user can select a new item in the combo that indicates that the handle has to be always in the middle.
